Tank Command and Control System TCCS

The main elements of the TCCS are the tactical terminal, the command computer, the mission data terminal and the driver's indication unit. The direct link to radio communication equipment warrants high-speed and faultless transmission of tactical situations, commands, messages and alarms.

The display of digitized terrain maps on a high-definition colour display allows military personnel to assess the situation continuously and also facilitates control of the map and orientation in the terrain. Information concerning target recognition and tactical situation (blue force tracking and red force tracking) is easily correlated. All equipment and links can be integrated in existing vehicles at comparatively little cost.

Main features
- Graphical situation display
- Orientation assistance on the battlefield
- Reports and alarm notification
- Built In Test Equipment (BITE)
